Gaudi Ultra-Low NOx Burner Selection Guide

Fully Premixed · Ultra-Low Nitrogen · Choose Gaodi

Gaudi - The Pioneer of Ultra-Low NOx Combustion

Aspiring to become a globally respected "national brand" in the field of ultra-low nitrogen oxide combustion.

CONTENTS

Fully Premixed · Ultra-Low Nitrogen · Choose Gaodi

COMPANY PROFILE

Shanghai Bylindo Thermal Energy Equipment Co., Ltd. is a high-tech environmentally friendly manufacturing enterprise specializing in the research, development, production, and sales of ultra-low nitrogen burners. The company is headquartered in Shanghai, China's economic hub, and is equipped with modern advanced production facilities and a team of experienced technical professionals. The company manufactures a wide range of burner products primarily used in gas boilers, heating furnaces, hot air furnaces, organic heat carrier furnaces, and other heating equipment. These products are widely applied in industrial heating, petroleum equipment, chemical smelting, and other fields. The company possesses strong independent R&D capabilities in the ultra-low nitrogen combustion sector, and its Gaudi brand ultra-low nitrogen burners have played a significant role in China's current environmental governance efforts.

Since its inception, the company has adhered to the business philosophy of "putting heart into every product." Emphasizing scientific research and development, the company has invested heavily in cutting-edge combustion technology R&D, obtaining multiple invention patents. It has also established long-term cooperative partnerships with Tongji University and the Thermal Energy College of Shanghai Jiao Tong University. Leveraging the academic strengths of these institutions and combining them with the company's extensive market experience, it maintains strict standards for its products. Each product model undergoes multiple rounds of screening and rigorous testing to ensure safety and stability. The company places great emphasis on quality management, adopting advanced production line processes and strictly adhering to the ISO9001 quality management system. Every step, from production to inspection and final delivery, is meticulously controlled. The company is committed to ensuring that every Gaudi brand burner leaving the factory meets the highest quality standards and earns the trust of its users. This relentless pursuit of excellence has made the Gaudi brand a trusted name among customers.

At this new starting point and on this new journey, the company will continue to uphold the philosophy of "putting people first and pursuing innovation." Driven by the mission to meticulously craft every product, the Gaudi team will face challenges head-on, continuously innovate, and strive to surpass expectations. The company aims to develop more efficient and environmentally friendly burners, making Chinese manufacturing a globally recognized name in the field of ultra-low nitrogen burners.

FORMATION MECHANISM

During the combustion process, oxygen (O_2) and nitrogen (N_2) in the air react through different pathways to form nitrogen oxides (NOx). Among these pollutants, nitric oxide (NO) and nitrogen dioxide (NO_2) have the most significant impact, contributing to air pollution and posing health risks to humans.

Research on NOx formation during combustion reveals that nitrogen oxides are primarily generated through three major pathways:

1.Thermal NOx

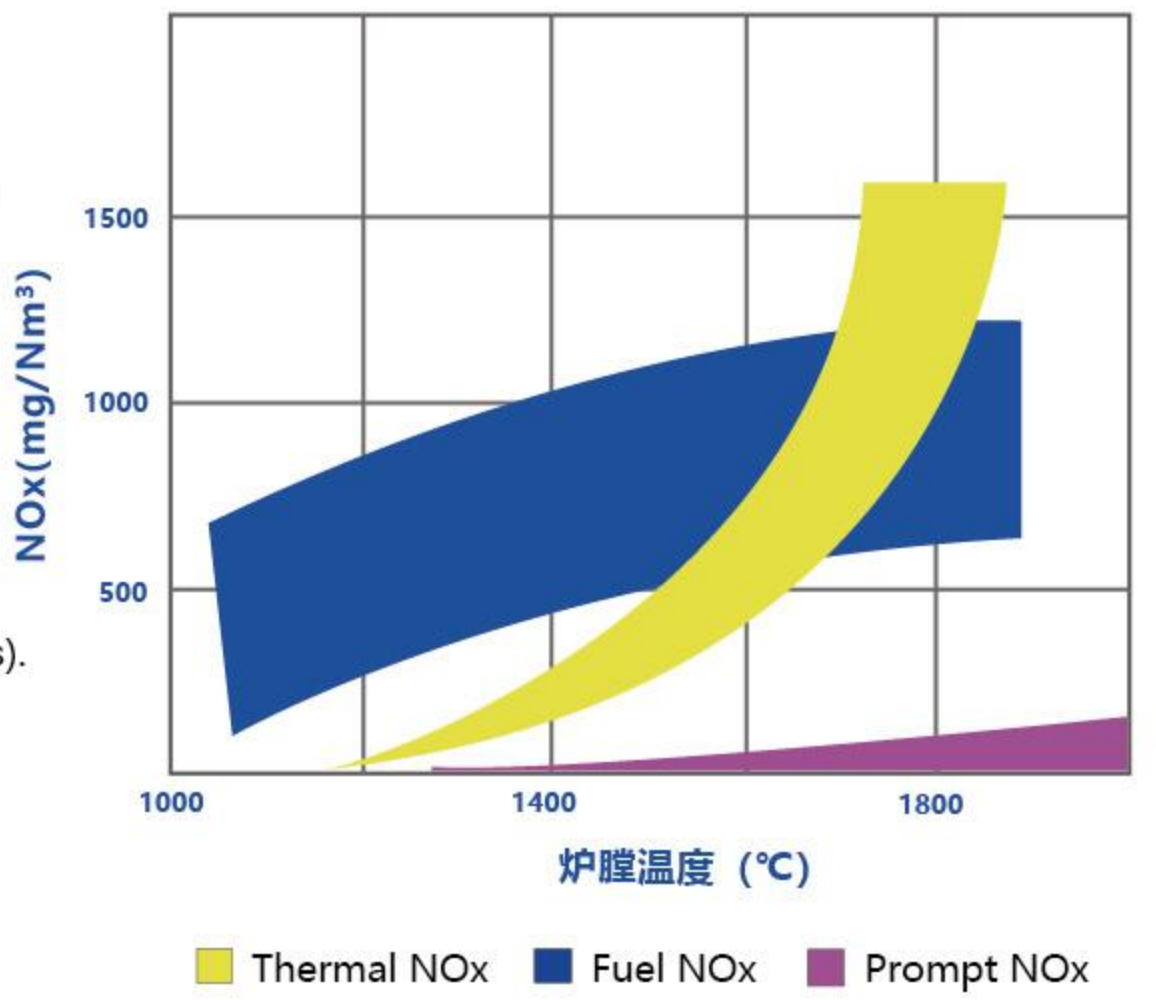
Primarily related to combustion temperature during burning.

2.Prompt NOx

Associated with the speed of chemical reactions.

3.Fuel NOx

Dependent on the nitrogen content in the fuel (generally negligible in most cases).



The primary technology currently used to lower boiler nitrogen oxide emissions is low-nitrogen combustion.

Premixed combustion technology

In this method, fuel gas and air are premixed before combustion. The burner head employs surface combustion, ensuring the flame is evenly distributed across the combustion surface. Due to the lower flame temperature, nitrogen oxide (NOx) emissions can be reduced to below 27 mg/m³.

FGR Technology

This technology primarily utilizes a low-NOx burner design, where a portion of the flue gas is extracted from the boiler exhaust and recirculated back to mix with the fuel and air for combustion. By diluting the air and reducing the oxygen concentration, it lowers the flame temperature, thereby achieving reduced nitrogen oxide (NOx) emissions.

Internal Flue Gas Recirculation (IFGR) Technology

This technology utilizes a specially designed burner head to internally recirculate flue gas within the combustion chamber, allowing it to mix back into the flame for secondary combustion. By doing so, it effectively reduces nitrogen oxide (NOx) emissions.

Pursuing perfection has always been Gaudí's consistent style. Providing customers with first-class products is our mission. Through continuous innovation and leading cutting-edge technology, we contribute to the advancement of "Made in China." We look forward to collaborating with you!

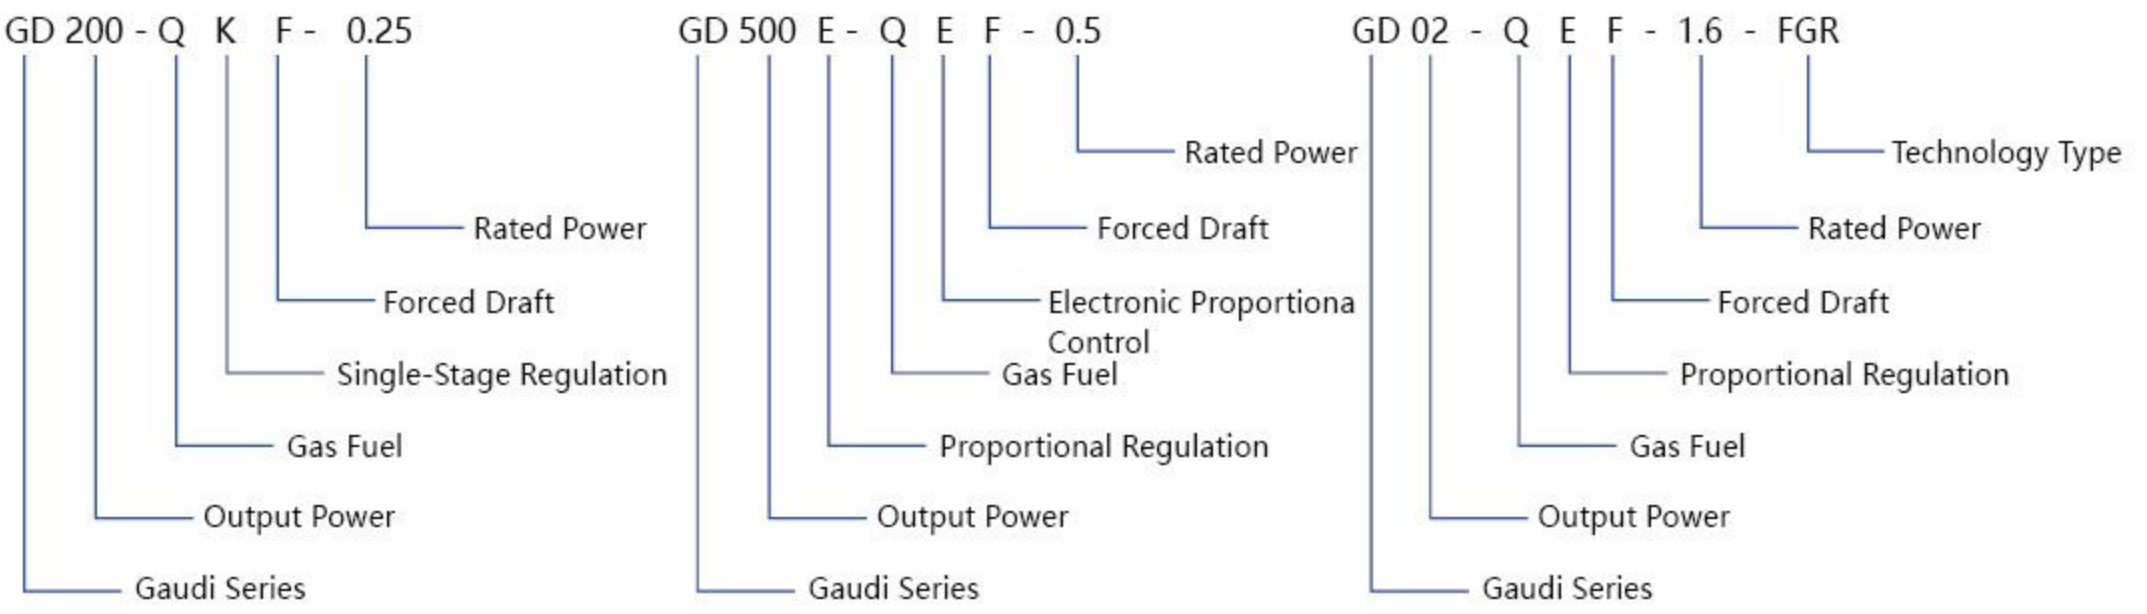
MODE OF OPERATION

高迪超低氮燃烧器符号释义



Ultra-Low NOx Burner Operation Modes

Single-Stage / Two-Stage Operation

- Single-stage operation: The burner operates in an on-off mode. Once the burner's adjustment settings are completed, its output power is fixed (though it may vary slightly due to external conditions), meaning the burner has only one operating point. The burner's start-stop is controlled by a TC (thermostat or pressure switch) on the control circuit.
- Two-stage operation: The burner operates in a low-fire / high-fire mode, meaning it has two operating points—it can run at either low-fire (1st stage) or high-fire (2nd stage). The burner's operation is controlled by two devices on the control circuit: a TC (thermostat or pressure switch) and a T2 (second-stage controller or switch) to regulate its operating state.

Electronic Proportional Modulation:

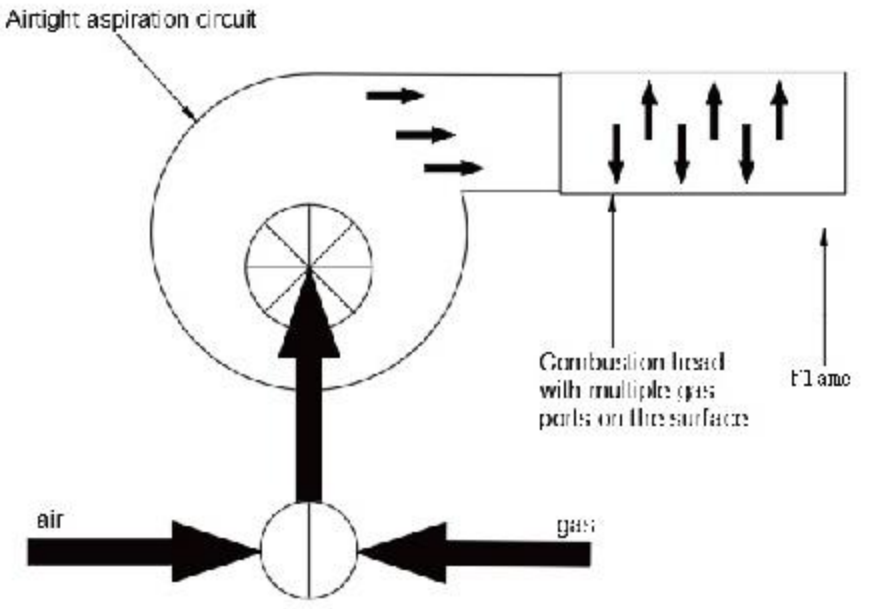
- Continuous Modulation – The burner can operate at any point within its capacity range, with output continuously adjusting to match the system's heating demand for optimal balance.
- Air-Gas Synchronization – A unique control system ensures precise, simultaneous adjustment of air and gas, enabling high combustion efficiency, stability, and low emissions.
- Self-Diagnostic Function – The system detects abnormalities or shutdowns and displays error codes for quick troubleshooting and fault identification.
- Runtime Monitoring & Data Logging – Tracks operating hours, stores historical records, and allows password-protected access (with tiered permissions) via software for system analysis.
- AZL Digital Programmer with LCD Interface – Features an integrated touchscreen/keypad for setting operating points, optimizing parameters, and automatically refreshing.
- Precision PID Load Control –Auto-optimized performance curves adapt to seasonal changes. Pre-configured curves can be directly selected and activated, eliminating repetitive manual adjustments.

PRODUCT RANGE

The Di Ultra-Low NOx Surface Burner adopts an imported fan and a specially designed metal surface head. Through the imported mixing fan, air and gas are perfectly blended and then delivered to the surface head for environmentally friendly and highly efficient combustion. Equipped with a high-precision Honeywell constant pressure valve, it ensures optimal air-fuel ratio coordination for precise adjustment, guaranteeing efficient combustion along with safety and stability.

The Di Ultra-Low NOx Surface Burner offers customizable surface heads based on on-site working conditions and power requirements, including multi-hole surface heads, woven surface heads, and sintered surface heads.

Burner Operation Schematic



Features of the Di Fully Premixed Ultra-Low NOx Burner:

- Uniform Flame & Ultra-Low Emissions – The flame is evenly distributed around the burner head, ensuring complete combustion with low flame temperatures, enabling ultra-low NOx emissions (<15 ppm).
- Constant Air-Fuel Ratio Technology – Precise control of gas and air prevents imbalance due to reduced air supply, ensuring safe and stable combustion.
- High-Efficiency Premixing – Equipped with an imported variable-frequency high-pressure premix fan, featuring anti-static properties, strong backpressure resistance, and excellent mixing performance for high combustion efficiency.
- Low Gas Pressure Requirement – Operates effectively at gas pressures as low as 2 kPa, ensuring stable combustion power and adaptability to various field conditions.
- Unique Ignition System Design – Simplified for easy maintenance and long-term servicing.
- Aesthetic Ambient Light Strips – Enhances both functionality (quick status identification) and visual appeal of the equipment.

Fully Premixed 50-520KW Series

Power Rane 50-520KW

Product Characteristics

1.Ultra-low nitrogen emission: low nitrogen emission （NOx<30mg/m³）。
2.High efficiency of combustion: through the electronic ratio adjustment system, it can realize the best air-fuel ratio of air and gas, and make the combustion more efficient.
3.Energy-saving combustion: air-fuel ratio constant technology, gas and air are totally mixed, the combustion is safe and stable.
4.Strong adaptability: Adopting pre-mixing before fan, high air pressure, can be applied to low pressure gas, wide range of application, only need a smaller furnace to achieve low nitrogen, suitable for most boilers.
5.Safety in use: Adopting flame detection system for real-time detection, gas air pressure protection, as well as gas leakage protection and operation fault display, make the whole combustion process safer.
6.Maintenance Convenience: one-piece design, convenient for subsequent maintenance

FGR Integrated Burner Series

The Gaodi External Flue Gas Recirculation Burner operates by extracting a portion of the flue gas emitted from the boiler and mixing it with the combustion air before reintroducing it into the combustion chamber for reburning. Since the flue gas contains a low level of oxygen, this process reduces the oxygen concentration in the mixed combustion air. Coupled with stratified combustion technology, it further lowers the flame temperature during combustion, thereby effectively inhibiting the formation of NOx.

Power Rane 800-6520KW

Product Characteristics

1.Ultra-low nitrogen emission: low nitrogen emission （NOx<30mg/m³）。
2.High Combustion Efficiency: Achieves the optimal air-fuel ratio through an electronic proportioning system, resulting in more efficient combustion.
3.Energy-Efficient Combustion: Unique staged combustion design of the burner head allows for low nitrogen emissions with minimal flue gas.
4.Strong Compatibility: Virtually no requirements for boiler inner dimensions, suitable for most boilers.
5.Operational Safety: Equipped with a flame detection system for real-time monitoring, gas and air pressure protection, gas leakage protection, and operational fault display, ensuring a safer combustion process.
6.Ease of Maintenance: Modular design with freely selectable fans, strong back pressure resistance, easily detachable burner head, facilitating convenient post-maintenance.

Custom Engineering Solutions

CORE COMPONENTS

The components utilized in burners are critical parts that ensure proper operation and safety. Our company exclusively selects internationally renowned, top-tier brands for burner components. These high-quality parts deliver stable and reliable performance with exceptional safety, ensuring perfect compatibility with the burners. This guarantees safe, stable, and highly efficient burner operation.

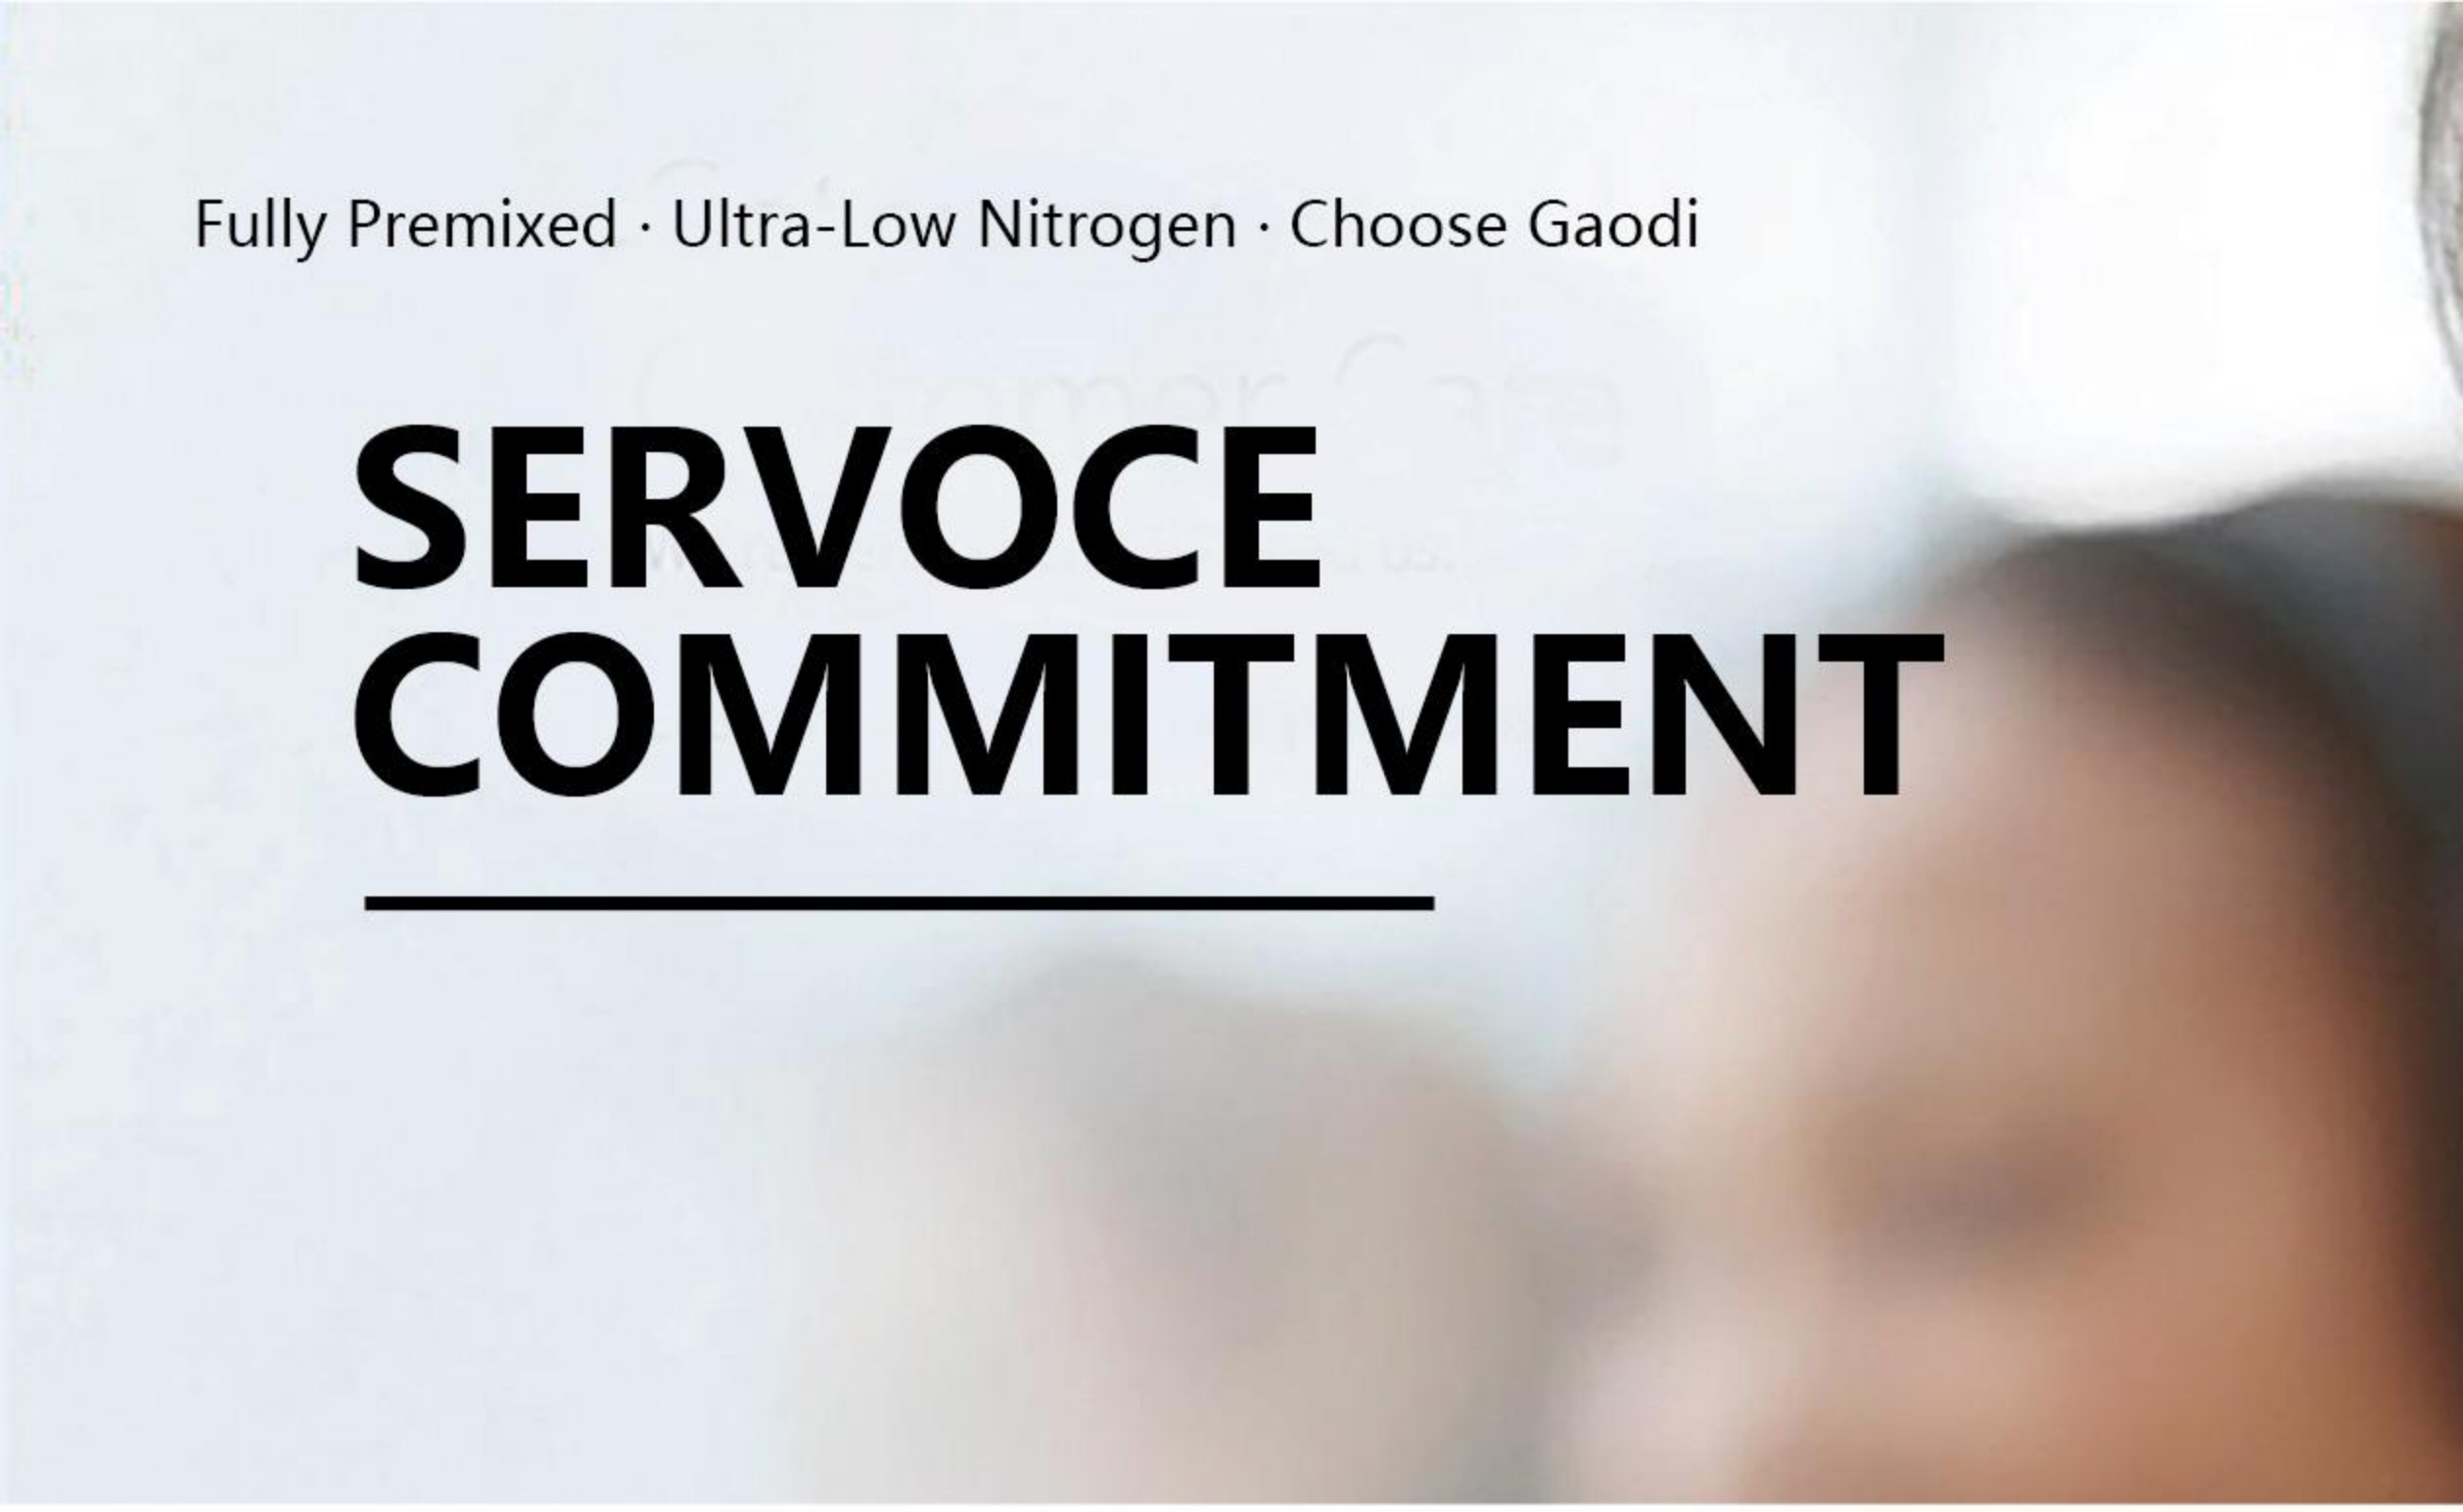
SERVOCE COMMITMENT



Shanghai Weijin Thermal Energy Equipment Co., Ltd.Since its establishment, our company has positioned product quality as the core competitiveness in the market. With all employees maintaining a strong awareness of both product quality and customer service, Weijin is committed to achieving greater success and reaching new heights in the burner industry.

Gaudi Burner guarantees that all equipment provided to users is brand new, unused, complies with the relevant terms of the contract, and meets the GB/T36699-2018 standard.

In accordance with product quality requirements, Gaudi has established a rigorous quality inspection system. The company implements strict management and control over all processes related to product quality, formulates scientific inspection procedures, and quantifies inspection criteria with clear accountability assigned to individuals. This ensures the company consistently produces qualified, high-quality products.

The company strictly controls raw materials to eliminate products without proper certification, selecting components from renowned domestic and international manufacturers. We have established stringent product process standards and maintain strong supply-demand relationships with our component suppliers.

Gaudi has implemented a regular employee quality training program to educate staff on the latest knowledge and information in quality management. This fosters a quality-conscious mindset among every employee, ensuring meticulous attention to detail in every aspect—from a single screw or wire to an entire machine. The quality inspection department follows standardized testing procedures, equipped with advanced detection tools and methods, to maintain comprehensive product testing records and prevent any substandard products from leaving the factory.

Every Gaudi burner model undergoes specialized equipment inspection and obtains certification from the China Special Equipment Inspection and Research Institute (CSEI), guaranteeing that each product delivered to customers is of excellent quality. Both now and in the future, we will continue striving to provide users with premium products and satisfactory service.
